1. Motivation

This project is grounded in a documented, industry-wide problem rather than a hypothetical one. Across agricultural lending, institutions commonly rely on fragmented spreadsheets and periodic manual reviews to track loan performance. Industry research on agricultural lending risk management ([LoanPro, 2026 \[1\]](#); [FarmRaise, 2025 \[2\]](#)) describes lenders still assembling portfolio risk views by hand, which delays the detection of early warning signs — rising credit utilization, delayed payments to suppliers, deteriorating liquidity, and repeated extensions or carryover financing. By the time these signals surface in a manual report, the window for early intervention has often already narrowed and become more costly.

This pattern is especially relevant to agricultural lenders because farm cash flow is seasonal and sensitive to commodity prices and weather, so risk can build gradually across a growing season before it becomes visible in a static report. A lender that can only see delinquency and concentration trends once a month, after a multi-day manual compilation process, is structurally behind the risk it is trying to manage.

Harvest Trust Financial (HTF) is a fictional Canadian agricultural lending institution created for this portfolio project. HTF's situation is designed to reflect this real, industry-wide pattern not to represent the internal systems of any specific real institution. No claims are made in this project about how any actual company, including Farm Credit Canada, manages its own reporting internally.

2. Background & Business Problem

2.1 Organization

Harvest Trust Financial (HTF) is a mid-sized Canadian agricultural lending institution headquartered in Regina, Saskatchewan, providing term loans and operating lines of credit to farm operations and agribusinesses across Saskatchewan, Alberta, and Manitoba. HTF's loan book spans several agricultural sectors, including grain and oilseed, livestock and dairy, and diversified/mixed farming operations.

2.2 Current State

HTF's Risk Management and Credit teams currently monitor loan delinquency, risk ratings, and portfolio performance through a manual monthly process: analysts export data from the core loan servicing system, reconcile it in Excel, and circulate static reports to leadership. This process has several recurring problems:

- **Slow turnaround:** compiling the monthly report takes 5–7 business days, so leadership is often reviewing data that is already 1–2 weeks stale by the time it's read.
- **Inconsistent definitions:** “risk tier” and “past due” are calculated slightly differently across analysts and spreadsheets, undermining trust in the numbers.
- **No drill-down:** reports are static exports; nobody can filter by region, sector, or risk tier between report cycles without requesting a new manual pull.
- **Hidden concentration risk:** there is no easy way to see how exposed the portfolio is to a single region or sector (for example, a high share of grain loans concentrated in one area), which matters because a drought or commodity price shock could hit many loans at once.
- **Weak audit trail:** manual spreadsheet handoffs make it hard to show exactly how a reported number was derived, which matters for internal audit and board-level reporting.

2.3 Why Now

Leadership has asked for a single, trusted, self-serve dashboard that replaces the manual report cycle one with agreed-upon definitions, regular automated refresh, and the ability for stakeholders to explore the data themselves instead of waiting on a scheduled export.

3. Project Objective

Design and deliver a Loan Portfolio Risk Reporting Dashboard, along with the supporting business analysis artifacts, that gives HTF stakeholders self-serve visibility into loan delinquency, risk tier distribution, and portfolio performance by region and sector replacing the manual monthly reporting process.

4. Scope

4.1 In Scope

- A documented business case, stakeholder analysis, and requirements set for the dashboard and its underlying data.
- A synthetic (fictional) loan portfolio dataset, generated in Python, realistic enough to support meaningful analysis.
- A defined data model (tables, relationships, fields) supporting the dashboard.
- A working Power BI dashboard covering delinquency trends, risk tier distribution, and region/sector performance, with filtering and drill-down.
- Standard definitions for key terms (e.g., delinquency buckets, risk tiers) applied consistently across all artifacts.

4.2 Out of Scope

- Live integration with a real core banking or loan servicing system (the dataset is synthetic and static).
- Any real client, loan, or financial data from FCC, or any other real institution.
- Automated regulatory filings or submissions.
- Predictive/ML-based credit scoring models (noted as a possible future enhancement, not part of this project).
- Changes to loan origination or underwriting workflows.

5. Stakeholders (High-Level)

A detailed stakeholder analysis including individual needs, influence, and a RACI breakdown is produced in Phase 2. At a high level, the following roles are involved:

- **Chief Risk Officer:** executive sponsor; owns portfolio-level risk oversight.
- **VP, Credit & Lending Operations:** owns lending decisions and delinquency follow-up.
- **Regional Credit Managers (SK / AB / MB):** manage regional loan books and client relationships.
- **Portfolio Risk Analysts:** primary dashboard users and maintainers; currently build the manual reports.
- **Finance & Treasury:** uses portfolio risk data to inform allowance for credit losses (ACL) estimates.
- **Internal Audit & Compliance:** needs confidence in data accuracy, consistency, and traceability.
- **IT / Data Team:** supports the underlying data pipeline and Power BI environment.

6. Success Criteria

- Reporting turnaround drops from 5–7 business days to near real-time, self-serve access.
- A single, agreed definition of “risk tier” and “delinquency bucket” is used consistently across the dashboard and all supporting documentation.
- Stakeholders can independently filter and drill down by region, sector, and risk tier without requesting a custom export.
- The dashboard runs on a defined refresh cadence rather than ad hoc manual pulls.
- Risk Management and Credit leads validate that the dashboard reflects what they need to do their jobs (represented in this project by a documented sign-off step).

7. Assumptions & Constraints

- **Fictional data only:** all organization names, people, and figures are invented for this portfolio project; no real client or proprietary data is used.
- **Single-author project:** Dwij Siyal performs all BA, data, and development roles that would normally be split across a project team.
- **Tooling:** dashboard is built in Power BI Desktop; Python (pandas/NumPy) is used for synthetic data generation.
- **Timeline:** the project is scoped to be completed in roughly 5–7 focused working days.
- **Realism target:** the synthetic dataset should be plausible enough (realistic field names, distributions, and value ranges) to support credible discussion in a job interview setting.

8. High-Level Timeline

Phase	Deliverable	Focus	Day(s)
1	Project Brief	Scenario, problem, objective	Day 1
2	Stakeholder Analysis	Needs, RACI, power/interest	Day 1
3	Requirements Document	Business / functional / non-functional	Day 2
4	Synthetic Dataset	Python-generated loan portfolio data	Day 3
5	Data Model Design	Tables, relationships, fields	Day 4
6	Power BI Dashboard	KPIs, visuals, filters, DAX	Day 4 – Day 6
7	Package & Present	PDF portfolio, README, resume bullet	Day 7

9. Risks

Risk	Likelihood	Mitigation
Synthetic data reads as unrealistic or obviously random	Medium	Base distributions on realistic ag-lending patterns (seasonality, sector mix, regional risk); validate outputs before building the dashboard.
Scope creep on dashboard polish at the expense of BA documentation	Medium	Timebox each phase; treat Phase 1–3 artifacts as equally important deliverables to the dashboard itself.
Stakeholder adoption - analysts and managers accustomed to Excel reporting may be slow to trust or switch to a new dashboard	Medium	Involve Regional Credit Managers and Portfolio Risk Analysts early (Phase 2), and require their documented sign-off before the dashboard is considered complete.

10. References

Industry sources used to validate the business problem as a genuine, documented pattern in agricultural lending (not as a claim about any specific real institution's internal systems):

PHASE 2

Stakeholder Analysis

Stakeholder matrix, Power/Interest matrix, and RACI chart mapping who needs this dashboard and how each group should be engaged.

Stakeholder Matrix

Loan Portfolio Risk Reporting Dashboard — Harvest Trust Financial (HTF)

Phase 2 of 7: **Stakeholder Analysis (Stakeholder Matrix)**

Prepared By: **Dwij Siyal**

Version: **1.0.**

Date: **1-Aug-26**

Stakeholder / Role	Department	Power	Interest	Quadrant	Key Needs from the Dashboard	Key Concerns / Pain Points	Engagement Strategy
Chief Risk Officer (CRO)	Executive / Risk Management	High	High	Manage Closely	Portfolio-level risk exposure trends; concentration risk by region/sector; confidence the dashboard reflects true risk.	Being blindsided by a risk event the old manual reports didn't surface in time.	Involve in brief/requirements sign-off; brief on key milestones; final go-live approval.
VP, Credit & Lending Operations	Credit / Lending	High	High	Manage Closely	Delinquency by branch/loan officer; a prioritized watch-list of at-risk loans.	Inconsistent risk-tier definitions undermining lending decisions; slow escalation of problem accounts.	Co-owns requirements; reviews and signs off on definitions and dashboard design.
Regional Credit Managers (SK / AB / MB)	Credit / Lending — Regional	Medium	High	Keep Informed	Region-level delinquency and sector concentration (e.g., grain vs. livestock exposure) for their territory.	Losing visibility into their own region's risk between monthly report cycles.	Consult during requirements gathering; give early preview/demo before go-live to build buy-in.
Portfolio Risk Analysts	Risk Management	Medium	High	Keep Informed	Granular, slice-able data: risk tier, days-past-due bucket, LTV, sector, region — the detail behind every KPI.	Currently own the manual reporting burden; worried a new tool won't cover an edge case they handle by hand today.	Primary working group for requirements and UAT; treat as co-designers, not just end users.
Finance & Treasury	Finance	High	Medium	Keep Satisfied	Aggregate portfolio exposure and risk-tier mix to inform Allowance for Credit Losses (ACL) estimates.	Numbers in the dashboard not reconciling with figures used in financial reporting.	Periodic high-level updates; confirm definitions align with financial reporting standards.
Internal Audit & Compliance	Audit / Compliance	High	Medium	Keep Satisfied	Confidence in data lineage, consistent definitions, and an auditable trail from source data to dashboard figure.	A dashboard that looks good but can't be traced back to source data if questioned.	Consult on data lineage/traceability requirements; review before go-live, not day-to-day.
IT / Data Team	Information Technology	Low	Low	Monitor	Clear, stable data source requirements and a manageable refresh schedule.	Being asked to support a tool with undocumented or shifting data requirements.	Inform of data/refresh requirements early; involve only when technical dependencies arise.

15

15

15

16

17

17

18

1. Purpose & Approach

This document translates the business problem and stakeholder needs identified in Phases 1 and 2 into specific, prioritized requirements for the Loan Portfolio Risk Reporting Dashboard. Requirements are grouped into three standard categories: Business Requirements (the underlying business need), Functional Requirements (what the dashboard must do), and Non-Functional Requirements (quality attributes such as performance, usability, and auditability).

Each requirement is prioritized using MoSCoW: Must have (required for the dashboard to meet its objective), Should have (important, included if time allows), Could have (nice to have, lower impact if deferred), and Won't have this round (explicitly deferred, listed in Section 7). Functional requirements are traced back to the business requirement they satisfy so that every feature in the dashboard has a clear reason for existing.

2. Key Definitions

- **Delinquency:** a loan is delinquent when a scheduled payment has not been received by its due date.
- **Days Past Due (DPD) Bucket:** loans are grouped by how late the oldest unpaid payment is: Current (0 days), 1–29 days, 30–59 days, 60–89 days, and 90+ days (considered non-performing).
- **Risk Tier:** a simplified 4-level scale used for dashboard reporting: Tier 1 (Low Risk), Tier 2 (Moderate Risk), Tier 3 (Elevated Risk), Tier 4 (High Risk / Watch List). Real institutions often use finer-grained internal rating scales (e.g., 9–12 point); this project uses a simplified 4-tier scale intentionally, to keep the dashboard readable at a glance.
- **Concentration Risk:** the share of the total portfolio exposed to a single region or sector; a high concentration means a single shock (e.g., drought, commodity price drop) could affect a large portion of the portfolio at once.
- **Watch List:** loans that have recently moved into a higher risk tier or delinquency bucket since the last data refresh, surfaced for proactive follow-up.

3. Business Requirements

ID	Requirement	Priority	Primary Stakeholder
BR1	Reduce reliance on manual, spreadsheet-based reporting for loan portfolio risk monitoring.	Must	VP, Credit & Lending Operations
BR2	Establish standardized, single-source definitions for risk tier and delinquency bucket, used consistently across all reporting.	Must	Portfolio Risk Analysts / Internal Audit
BR3	Provide self-serve, near real-time visibility into portfolio performance by region and sector.	Must	Chief Risk Officer
BR4	Support internal audit and compliance needs for data traceability and lineage.	Should	Internal Audit & Compliance

4. Functional Requirements

ID	Requirement	Priority	Traces to
FR1	Display top-level portfolio KPIs (total outstanding balance, weighted delinquency rate, active loan count, total watch-list balance) on a summary page.	Must	BR3
FR2	Allow filtering of all visuals by Region (SK/AB/MB), Sector, and Risk Tier.	Must	BR3
FR3	Display a delinquency rate trend over the trailing 12 months.	Must	BR3
FR4	Display portfolio concentration (% of total outstanding balance) by region and by sector.	Must	BR3
FR5	Categorize every loan into a standard days-past-due (DPD) bucket using a single, documented calculation.	Must	BR2
FR6	Assign each loan a Risk Tier (1–4) based on a documented, consistent methodology.	Must	BR2
FR7	Provide drill-through from portfolio/region/sector level down to individual loan-level detail.	Should	BR3
FR8	Flag loans that moved into a higher risk tier or delinquency bucket since the prior refresh (“Watch List”).	Should	BR1, BR3
FR9	Refresh underlying data on a defined, documented schedule rather than ad hoc manual pulls.	Must	BR1
FR10	Allow export of the current filtered data view for offline stakeholder use.	Could	BR3
FR11	Maintain a visible data dictionary / definitions reference within the dashboard file.	Should	BR2, BR4

5. Non-Functional Requirements

ID	Category	Requirement	Priority
NFR1	Performance	Dashboard visuals shall render within ~10 seconds under normal filter operations.	Should
NFR2	Usability / Accessibility	Visuals shall use a consistent, colourblind-safe palette for risk-tier indicators (not relying on red/green alone).	Should
NFR3	Auditability	Every calculated field (risk tier, DPD bucket, concentration %) shall have its logic documented so a reviewer can trace a figure back to its source fields.	Must
NFR4	Security / Access	Production use would require role-based, view-only access for most business users. Documented here as a requirement; implementation is out of scope for this single-author fictional build.	Must (documented)
NFR5	Maintainability	Data model and DAX measures shall be structured (star schema, named measures) so another analyst could maintain the dashboard without rebuilding it.	Should
NFR6	Tooling / Portability	Solution shall be built entirely in Power BI Desktop without dependency on paid add-ins or external services.	Must

6. Traceability Matrix

A summary view of which functional (and non-functional) requirements satisfy each business requirement used to confirm nothing in scope is unaccounted for, and nothing built lacks a business reason.

Business Requirement	Description	Satisfied By
BR1	Reduce reliance on manual reporting	FR8, FR9
BR2	Standardized risk tier & delinquency definitions	FR5, FR6, FR11
BR3	Self-serve, near real-time regional/sector visibility	FR1, FR2, FR3, FR4, FR7, FR8, FR10
BR4	Audit & compliance traceability	FR11, NFR3

7. Out of Scope / Deferred

- Predictive or ML-based credit risk scoring (potential future enhancement).
- Real-time (sub-daily) data refresh — this project uses a defined periodic refresh schedule instead.
- Mobile-optimized dashboard layout.
- Automated regulatory filing or submission generation.
- Implementation of production-grade, role-based security (documented as NFR4, not built, given the single-author fictional scope).

PHASE 4

Synthetic Dataset Generation

A fictional, entirely synthetic loan portfolio dataset was generated in Python (pandas/NumPy) to support the dashboard build. The full generation script and resulting CSV files are included in this repository under 04_data/, rather than reproduced in full here.

What was generated:

- 380 borrowers across Saskatchewan, Alberta, and Manitoba, spanning four agricultural sectors (Grain & Oilseed, Livestock, Dairy, Mixed Farming).
- 539 loans (Term Loans, Operating Lines of Credit, Equipment Loans, Farm Mortgages) with realistic principal, rate, and collateral ranges by loan type.
- A 24-month monthly snapshot (9,372 rows) modeling seasonality deliberately — higher delinquency risk in the pre-seeding spring months, lower risk post-harvest — rather than random noise.
- Two validated bugs were caught and fixed during generation: Operating Lines of Credit incorrectly “maturing” after one year (they are revolving, not term, facilities), and a delinquency-rate model with no mean-reversion that drifted from 5% to 18% over two years instead of settling around a stable baseline.

PHASE 5

Data Model Design

The snowflake schema powering the dashboard: an entity-relationship diagram, table relationships, and a complete field-level data dictionary.

Data Model Design — Model Overview

Loan Portfolio Risk Reporting Dashboard — Harvest Trust Financial (HTF)

Phase 5 of 7: Data Model Design

Prepared By: Dwij Siyal

Version: 1.0.

Date: 5-Aug-26

Schema type: Snowflake schema: one fact table plus five dimension/lookup tables, with dim_loan connected to dim_borrower (rather than borrower attributes flattened onto dim_loan), since a borrower can hold multiple loans and this avoids repeating borrower details on every loan row.

Fact table grain: fact_loan_monthly_snapshot holds one row per active loan per calendar month this grain is what makes the trailing-12-month delinquency trend (FR3) and the month-over-month watch-list flag (FR8) possible; a single point-in-time snapshot would not support either.

Source: all six tables are generated by generate_synthetic_data.py (Phase 4) and exported as CSV to /04_data/raw/. This workbook documents that output for use in the Power BI build (Phase 6).

Table Inventory

Table	Type	Grain (one row per...)	Row Count	Purpose
dim_borrower	Dimension	borrower	380	Borrower/client attributes: region, sector, farm size, relationship history.
dim_loan	Dimension	loan	539	Loan-level static attributes: type, principal, rate, collateral, current status.
fact_loan_monthly_snapshot	Fact	loan + month	9,372	Monthly balance, delinquency, and risk-tier position for every active loan.
dim_risk_tier	Lookup	risk tier (1-4)	4	Friendly labels and sort order for the 4-tier risk scale.
dim_dpd_bucket	Lookup	DPD bucket	5	Friendly labels, sort order, and delinquency flag for DPD buckets.
dim_calendar	Lookup	month	24	Monthly calendar dimension for time intelligence (trailing-12-month trend, etc.).

Loan Portfolio Risk Reporting Dashboard — Data Model (Snowflake Schema)

Grey = dimension tables (descriptive attributes) | Orange = fact table (one row per loan per month)
 Lines run from the "many" side to the "one" side, matching Power BI relationship convention.

Table Relationships

All relationships are one-to-many, filtering from the dimension ("1" side) to the fact table ("many" side) — standard Power BI direction.

Phase 5 of 7: Data Model Design (Table Relationships)

Prepared By: Dwij Siyal

Version: 1.0.

Date: 5-Aug-26

From Table ("1" side)	Key	To Table ("many" side)	Key	Relationship
dim_borrower	borrower_id	dim_loan	borrower_id	One-to-Many: One borrower can hold multiple loans.
dim_loan	loan_id	fact_loan_monthly_snapshot	loan_id	One-to-Many: One loan generates one row per month it is active.
dim_calendar	snapshot_month	fact_loan_monthly_snapshot	snapshot_month	One-to-Many: One calendar month applies to many loan snapshots.
dim_risk_tier	risk_tier	fact_loan_monthly_snapshot	risk_tier	One-to-Many: One risk tier applies to many loan-month snapshots.
dim_dpd_bucket	dpd_bucket	fact_loan_monthly_snapshot	dpd_bucket	One-to-Many: One DPD bucket applies to many loan-month snapshots.

Data Dictionary

Note: This contains every field across all six tables. Filter the Table column in Excel to focus on one table at a time.

Phase 5 of 7: Data Model Design (Data Dictionary)

Prepared By: Dwij Siyal

Version: 1.0.

Date: 5-Aug-26

Table	Field	Key	Data Type	Description	Example	Business Rule / Derivation
dim_borrower	borrower_id	PK	Text	Unique identifier for the borrower.	BOR-1001	Format: BOR-#### (sequential).
dim_borrower	borrower_name		Text	Legal/operating name of the borrower's farm or agribusiness.	Whitmore Prairie Grain Farms Ltd.	Fictional; generated from a surname + descriptor + sector-appropriate entity type.
dim_borrower	region		Text	Province where the borrower operates.	Saskatchewan	One of: Saskatchewan, Alberta, Manitoba.
dim_borrower	sector		Text	Primary agricultural sector.	Grain & Oilseed	One of: Grain & Oilseed, Livestock, Dairy, Mixed Farming.
dim_borrower	years_in_operation		Whole Number	Years the operation has been running.	19	Generated 2-60 years.
dim_borrower	operation_size_acres		Whole Number	Approximate operating land size in acres.	1,715	Populated only for Grain & Oilseed / Mixed Farming; blank for Livestock/Dairy where acreage is not the primary size metric.
dim_borrower	herd_size_head		Whole Number	Approximate herd size in head of livestock.	213	Populated only for Livestock / Dairy / Mixed Farming; blank for pure Grain & Oilseed operations.
dim_borrower	relationship_start_date		Date	Date the borrower became an HTF client.	2015-07-01	Always on/before the borrower's earliest loan origination date.
dim_borrower	primary_loan_officer		Text	HTF loan officer assigned to this relationship.	R. Yaremko	Consistent across all loans held by the same borrower.
dim_loan	loan_id	PK	Text	Unique identifier for the loan.	LN-20001	Format: LN-##### (sequential).
dim_loan	borrower_id	FK -> dim_borrower	Text	Borrower who holds this loan.	BOR-1001	Each loan belongs to exactly one borrower.
dim_loan	loan_type		Text	Loan product type.	Term Loan	One of: Term Loan, Operating Line of Credit, Equipment Loan, Farm Mortgage.
dim_loan	origination_date		Date	Date the loan was originated.	2021-07-01	On/after the borrower's relationship_start_date.
dim_loan	maturity_date		Date	Scheduled maturity (or, for revolving lines, next annual renewal date).	2026-07-01	Term loans: origination + amortization_years. Operating Lines of Credit: annual renewal date, rolled forward to on/after the reporting window's last month.
dim_loan	original_principal		Currency	Original loan amount (or credit limit, for a Line of Credit).	\$780,800	Range varies by loan_type (e.g., Farm Mortgage: \$200K-\$3M; Operating LOC: \$50K-\$500K).
dim_loan	interest_rate		Percentage	Annual interest rate.	6.08%	Range varies by loan_type, approx. 5.5%-9.0%.
dim_loan	amortization_years		Whole Number	Amortization period in years.	7	Operating Lines of Credit use 1 (annual renewal, not a true amortization).
dim_loan	collateral_type		Text	Primary collateral securing the loan.	Equipment	One of: Farmland, Equipment, Livestock, General Security Agreement.

dim_loan	collateral_value		Currency	Appraised value of the collateral.	\$1,046,100	Generated as 1.0x-2.2x original_principal, depending on collateral_type.
dim_loan	loan_status		Text	Current lifecycle status of the loan.	Active	One of: Active, Paid Off, Default/Charged Off. Reflects status as of the last snapshot month.
fact_loan_monthly_snapshot	loan_id	FK -> dim_loan	Text	Loan this snapshot row belongs to.	LN-20001	One row per loan per active month.
fact_loan_monthly_snapshot	snapshot_month	FK -> dim_calendar	Date	First day of the snapshot month.	2026-07-01	24 consecutive months, Aug 2024 - Jul 2026.
fact_loan_monthly_snapshot	outstanding_balance		Currency	Loan balance outstanding as of this month.	\$765,801.55	Term loans: standard amortization formula. Lines of Credit: credit limit x simulated utilization rate (seasonally adjusted).
fact_loan_monthly_snapshot	scheduled_payment		Currency	Scheduled monthly payment as of this month.	\$11,436.33	Term loans: standard amortizing payment formula. Lines of Credit: interest-only estimate on the current balance.
fact_loan_monthly_snapshot	days_past_due		Whole Number	Days since the oldest unpaid scheduled payment.	0	0 when dpd_bucket = Current; otherwise a value within that bucket's range.
fact_loan_monthly_snapshot	dpd_bucket	FK -> dim_dpd_bucket	Text	Days-past-due bucket for this month.	Current	One of: Current, 1-29 Days, 30-59 Days, 60-89 Days, 90+ Days. See Phase 3 Requirements Doc, Section 2, for definitions.
fact_loan_monthly_snapshot	risk_tier	FK -> dim_risk_tier	Whole Number	Risk tier (1-4) for this month.	3	Base tier reflects underlying borrower credit quality; tier is bumped by 1 (max 4) when dpd_bucket reaches 60-89 or 90+ Days.
fact_loan_monthly_snapshot	loan_status_snapshot		Text	Loan status as of this specific month.	Active	"Delinquent - Default Pending" appears only in the final month before a loan exits to Default/Charged Off.
fact_loan_monthly_snapshot	watch_list_flag		Text (Y/N)	Flags a loan whose risk tier or DPD bucket worsened vs. the prior month.	N	Y when risk_tier increased, or dpd_bucket moved to a more severe bucket, vs. the prior snapshot_month for the same loan (FR8).
dim_risk_tier	risk_tier	PK	Whole Number	Risk tier number.	3	1 (lowest risk) to 4 (highest risk).
dim_risk_tier	risk_tier_label		Text	Display label for the tier.	Tier 3 - Elevated Risk	Used for dashboard slicers/legends instead of the raw number.
dim_risk_tier	sort_order		Whole Number	Display sort order.	3	Matches risk_tier; ensures Tier 1 - 4 sort correctly (not alphabetically).
dim_dpd_bucket	dpd_bucket	PK	Text	DPD bucket label.	30-59 Days	One of the 5 standard buckets.
dim_dpd_bucket	sort_order		Whole Number	Display sort order.	2	0 (Current) to 4 (90+ Days); prevents buckets sorting alphabetically (e.g., "1-29" before "90+").
dim_dpd_bucket	is_delinquent		Whole Number (0/1)	Flags whether the bucket counts as delinquent.	1	0 for Current only; 1 for all other buckets. Powers the overall delinquency-rate KPI.
dim_calendar	snapshot_month	PK	Date	First day of the month.	2026-07-01	Matches fact_loan_monthly_snapshot.snapshot_month exactly.
dim_calendar	year		Whole Number	Calendar year.	2026	Derived from snapshot_month.
dim_calendar	month_number		Whole Number	Month number (1-12).	7	Derived from snapshot_month.
dim_calendar	month_name		Text	Full month name.	July	Derived from snapshot_month.
dim_calendar	quarter		Text	Calendar quarter.	Q3	Derived from snapshot_month.
dim_calendar	month_year_label		Text	Short display label.	Jul 2026	Used for chart axis labels.

PHASE 6

Dashboard Build Guide

DAX measures, page-by-page visual specifications, filter/slicer design, and colourblind-accessible formatting guidance used to build the Power BI report.

POWER BI DASHBOARD BUILD GUIDE

Loan Portfolio Risk Reporting Dashboard

Phase 6 — Harvest Trust Financial (HTF)

0. Model Setup (Before Building Visuals)

- **Sort by Column** — set dim_risk_tier[risk_tier_label] to sort by sort_order, dim_dpd_bucket[dpd_bucket] to sort by sort_order, and dim_calendar[month_year_label] to sort by snapshot_month. Without this, buckets and months sort alphabetically instead of chronologically/by severity.
- **Hide technical columns** — in Model view, right-click sort_order (on both lookup tables) and is_delinquent, and select "Hide in Report View." These exist to drive sorting/logic, not to be picked by end users in a field list.
- **Create a Measures table** — Home → Enter Data → 0 rows → name it _Measures. All DAX below lives here, not scattered inside fact_loan_monthly_snapshot.
- **Set data categories** — mark dim_calendar[snapshot_month] as a Date field; mark original_principal, outstanding_balance, scheduled_payment, collateral_value as Currency format (not just Decimal) so cards show "\$" automatically.

1. DAX Measures

Grouped by purpose. Two versions of the delinquency-rate logic exist deliberately: a "current" version pinned to the latest snapshot month for KPI cards, and an unpinned version for the trend line chart, where each point should reflect its own month.

1.1 Latest Month Helper

Latest Snapshot Month

Returns whichever month is most recent within the current slicer selection. Used inside every "current state" KPI measure below so cards always show the latest month, even while a trend chart on the same page shows all 24 months.

```
Latest Snapshot Month =  
CALCULATE(  
    MAX(dim_calendar[snapshot_month]),  
    ALLSELECTED(dim_calendar)  
)
```

1.2 Core Portfolio KPIs (latest month, or the selected month, for card visuals)

Total Outstanding Balance

```
Total Outstanding Balance =  
CALCULATE(  
    SUM(fact_loan_monthly_snapshot[outstanding_balance]),  
    dim_calendar[snapshot_month] = [Latest Snapshot Month]
```

```
)
```

Active Loan Count

```
Active Loan Count =  
CALCULATE(  
    DISTINCTCOUNT(fact_loan_monthly_snapshot[loan_id]),  
    dim_calendar[snapshot_month] = [Latest Snapshot Month]  
)
```

Delinquency Rate % (Current)

Weighted by dollar balance, not loan count — a \$2M delinquent loan matters more to portfolio risk than a \$20K one. This is the version for the summary KPI card.

```
Delinquency Rate % (Current) =  
VAR Latest Snapshot Month = Latest Snapshot Month  
VAR TotalBal =  
    CALCULATE(SUM(fact_loan_monthly_snapshot[outstanding_balance]),  
        dim_calendar[snapshot_month] = Latest Snapshot Month)  
VAR DelinqBal =  
    CALCULATE(SUM(fact_loan_monthly_snapshot[outstanding_balance]),  
        dim_calendar[snapshot_month] = Latest Snapshot Month,  
        dim_dpd_bucket[is_delinquent] = 1)  
RETURN DIVIDE(DelinqBal, TotalBal)
```

NPL Rate % (90+ Days, Current)

Non-performing loan rate — the more severe subset of delinquency. Standard companion metric to the overall delinquency rate in credit risk reporting.

```
NPL Rate % (Current) =  
VAR Latest Snapshot Month = [Latest Snapshot Month]  
VAR TotalBal =  
    CALCULATE(SUM(fact_loan_monthly_snapshot[outstanding_balance]),  
        dim_calendar[snapshot_month] = Latest Snapshot Month)  
VAR NPLBal =  
    CALCULATE(SUM(fact_loan_monthly_snapshot[outstanding_balance]),  
        dim_calendar[snapshot_month] = Latest Snapshot Month,  
        fact_loan_monthly_snapshot[dpd_bucket] = "90+ Days")  
RETURN DIVIDE(NPLBal, TotalBal)
```

Watch List Balance

```
Watch List Balance =  
CALCULATE(  
    SUM(fact_loan_monthly_snapshot[outstanding_balance]),
```

```

dim_calendar[snapshot_month] = [Latest Snapshot Month],
fact_loan_monthly_snapshot[watch_list_flag] = "Y"
)

```

Watch List Loan Count

```

Watch List Loan Count =
CALCULATE(
    DISTINCTCOUNT(fact_loan_monthly_snapshot[loan_id]),
    dim_calendar[snapshot_month] = [Latest Snapshot Month],
    fact_loan_monthly_snapshot[watch_list_flag] = "Y"
)

```

1.3 Trend Measure (unpinned — for the line chart)

Delinquency Rate % (Trend)

No Latest Month override — when placed on a chart with dim_calendar[month_year_label] on the axis, each point naturally computes its own month's rate.

```

Delinquency Rate % (Trend) =
VAR TotalBal = SUM(fact_loan_monthly_snapshot[outstanding_balance])
VAR DelinqBal =
    CALCULATE(SUM(fact_loan_monthly_snapshot[outstanding_balance]),
        dim_dpd_bucket[is_delinquent] = 1)
RETURN DIVIDE(DelinqBal, TotalBal)

```

1.4 Concentration Measures (region/sector, % of total portfolio)

Portfolio Share %

The denominator strips out region and sector filters so each bar shows its share of the WHOLE portfolio, not 100% of itself. This is the concentration-risk metric your Phase 1 brief is built around.

```

Portfolio Share % =
VAR Latest Snapshot Month = [Latest Snapshot Month]
VAR CategoryBal =
    CALCULATE(SUM(fact_loan_monthly_snapshot[outstanding_balance]),
        dim_calendar[snapshot_month] = Latest Snapshot Month)
VAR TotalBal =
    CALCULATE(
        SUM(fact_loan_monthly_snapshot[outstanding_balance]),
        dim_calendar[snapshot_month] = Latest Snapshot Month,
        ALL(dim_borrower[region]),
        ALL(dim_borrower[sector])
    )

```

```
RETURN DIVIDE(CategoryBal, TotalBal)
```

1.5 Optional / Bonus Measures (Could Have — skip if short on time)

Weighted Avg Interest Rate

```
Weighted Avg Interest Rate =  
VAR Latest Snapshot Month = [Latest Snapshot Month]  
RETURN  
DIVIDE(  
    CALCULATE(  
        SUMX(fact_loan_monthly_snapshot,  
            fact_loan_monthly_snapshot[outstanding_balance] *  
RELATED(dim_loan[interest_rate])),  
        dim_calendar[snapshot_month] = Latest Snapshot Month),  
    [Total Outstanding Balance]  
)
```

Delinquency Rate % MoM Change

Uses Target Month as its reference point too, so if you've drilled into a specific past month, the comparison is against the month before THAT one — not always the true latest month.

```
Delinquency Rate % MoM Change =  
VAR Latest Snapshot Month = [Latest Snapshot Month]  
VAR PriorMonth = CALCULATE(MAX(dim_calendar[snapshot_month]),  
    dim_calendar[snapshot_month] < Latest Snapshot Month, ALLSELECTED(dim_calendar))  
VAR CurrentRate = [Delinquency Rate % (Current)]  
VAR PriorRate =  
    CALCULATE([Delinquency Rate % (Trend)], dim_calendar[snapshot_month] =  
PriorMonth)  
RETURN CurrentRate - PriorRate
```

2. Report Pages & Visuals

Page 1 — Portfolio Overview

Purpose: answers "how healthy is the portfolio right now, and is it trending the right way" — the page a CRO opens first. Satisfies FR1, FR3.

- **KPI card row (top, 5 cards):** Total Outstanding Balance · Active Loan Count · Delinquency Rate % (Current) · NPL Rate % (Current) · Watch List Balance.
- **Delinquency Rate Trend** — line chart, X-axis = dim_calendar[month_year_label], Y-axis = Delinquency Rate % (Trend). This is the single most important visual on the page — it's what replaces the old static monthly report.
- **Risk Tier Distribution** — stacked bar or donut, Legend = dim_risk_tier[risk_tier_label] (colorblind-safe palette, see Section 4), Value = Total Outstanding Balance (Current). Shows risk mix by dollars, not loan count.
- **Portfolio Concentration by Sector** — bar chart, Axis = dim_borrower[sector], Value = Portfolio Share %. This is the concentration-risk visual your Phase 1 brief exists to deliver.

Page 2 — Regional & Sector Analysis

Purpose: lets Regional Credit Managers and the CRO see where risk is concentrated geographically and by sector, together. Satisfies FR2, FR4.

- **Region × Sector matrix** — Rows = dim_borrower[region], Columns = dim_borrower[sector], Values = Total Outstanding Balance and Delinquency Rate % (Current). Apply conditional formatting (background color scale) to the delinquency column — this is your concentration + risk heat map in one visual.
- **Delinquency Trend by Region** — line chart, X-axis = month_year_label, Y-axis = Delinquency Rate % (Trend), Legend = region. Shows whether one region is driving portfolio-wide trends.
- **Portfolio Concentration by Region** — bar chart, Axis = region, Value = Portfolio Share %.

Note: Power BI's built-in Map/Filled Map visuals need Bing/Azure Maps geocoding and can be unreliable for province-level fictional data offline. A bar chart by region is the more reliable choice here and is what the requirements actually call for (FR4 asks for % concentration, not a literal map).

Page 3 — Watch List & Loan Detail

Purpose: the operational page — the specific loans that need follow-up this month. Satisfies FR7, FR8.

- **Watch List table** — Table visual filtered to watch_list_flag = "Y" and the latest snapshot_month. Columns: loan_id, borrower_name, region, sector, risk_tier_label, dpd_bucket, outstanding_balance, primary_loan_officer. Sort descending by outstanding_balance so the largest at-risk exposures surface first.
- **Conditional formatting** — background color scale on dpd_bucket (or an icon set) using the same palette as Page 1's risk tier chart, for visual consistency.
- **Drillthrough page** — add a hidden page named "Loan Detail." Drag loan_id into the Drillthrough filter well. Add card visuals for the loan's static attributes (loan_type, origination_date, original_principal, collateral_type/value from dim_loan) plus a small line chart of that single loan's outstanding_balance and days_past_due over the 24-month window. Right-clicking any loan row on Page 3 (or any table with loan_id) now offers "Drill through → Loan Detail."

Page 4 — Definitions & Data Sources

Purpose: satisfies FR11 (a visible data dictionary within the dashboard file itself, not just in a separate Word doc). Add text boxes reproducing the glossary from the Phase 3 Requirements Document:

- Delinquency, Days Past Due (DPD) Bucket, Risk Tier, Concentration Risk, Watch List — same definitions as Phase 3, Section 2.
- A short note: "Data refreshed monthly. Current data through: " + a card showing [Latest Snapshot Month].
- A note that this is a fictional dataset for portfolio demonstration purposes (keeps the file honest if shared publicly, e.g., on GitHub).

3. Filters & Slicers

Slicer	Field	Sync Across Pages?
Region	dim_borrower[region]	Yes — Pages 1, 2, 3
Sector	dim_borrower[sector]	Yes — Pages 1, 2, 3
Risk Tier	dim_risk_tier[risk_tier_label]	Yes — Pages 1, 2, 3
Snapshot Month	dim_calendar[month_year_label]	Pages 1 & 2 only — Page 3's Watch List is deliberately always "current," not historically filterable, matching how a watch list is used operationally.

Set up sync via View → Sync Slicers. For the Region/Sector/Risk Tier slicers, tick both "Sync" and "Visible" on Pages 1-3; for Snapshot Month, tick "Sync" on Pages 1-2 only, leave Page 3 unticked.

4. Formatting & Color

- **Risk tier palette (colorblind-safe, NFR2)** — avoid a plain red/green scale, which is indistinguishable to the most common forms of color blindness. Use this 4-color ramp (ColorBrewer-style, ranges from blue through orange to red so severity reads through lightness and hue together, not red/green alone):

Risk Tier	Hex Code	Swatch Meaning
Tier 1 - Low Risk	#2C7BB6 (blue)	Healthy
Tier 2 - Moderate Risk	#ABD9E9 (light blue)	Acceptable
Tier 3 - Elevated Risk	#FDAE61 (orange)	Needs attention
Tier 4 - High Risk / Watch List	#D7191C (red)	Priority follow-up

- **Apply consistently** — use these exact 4 colors for the Page 1 risk-tier chart legend, and for DPD-bucket conditional formatting on Page 3 (map Current/1-29 to the blue end, 90+ to red).
- **KPI cards** — use conditional formatting or a callout color on Delinquency Rate % and Watch List Balance cards only if they exceed a threshold you decide (e.g., red text if Delinquency Rate % (Current) > 10%) — optional, but a nice touch that shows the dashboard actively flags problems rather than just displaying numbers.

- **Titles & consistency** — every visual gets a plain-language title ("Delinquency Rate — Trailing 24 Months", not the raw measure name); keep fonts consistent (Segoe UI, Power BI's default, is fine).

5. Final QA Checklist

- Total Outstanding Balance on Page 1 matches the sum you validated in Phase 4 (~\$219M as of the last snapshot month) — if not, check the Latest Snapshot Month / Target Month measures and relationship directions in Model view.
- Clear all slicers and confirm every visual still renders (no blank charts, no #ERROR).
- Select a single past month in the Snapshot Month slicer (e.g., an early month like Aug 2024) and confirm the KPI cards show that month's figures instead of going blank — this is the Target Month fix in action.
- Apply Region = Saskatchewan and confirm every visual updates together (tests slicer sync).
- Right-click a loan on the Page 3 Watch List table and confirm Drillthrough → Loan Detail works and shows that loan's history.
- Check risk tier and DPD bucket sort order render Tier 1→4 and Current→90+, not alphabetically.
- Save as Loan_Portfolio_Risk_Dashboard.pbix.

PHASE 6 (CONT.)

Dashboard Screenshots

The finished Power BI report: four report pages plus a drill through detail view, built from the model and measures documented above.

Portfolio Overview

Executive summary: portfolio KPIs, 24-month delinquency trend, risk tier mix, and sector concentration.

Regional & Sector Analysis

Region x sector risk heat map -- surfaces that Saskatchewan/Livestock carries a 17.82% delinquency rate, well above every other segment.

Total						\$5,249,511.68

Data & Definitions

Glossary embedded directly in the dashboard file, satisfying the requirement for a visible, single source of truth on key terms.

Data and Definitions

- **Delinquency:** a loan is delinquent when a scheduled payment has **not been** received by its due date.
- **Days Past Due (DPD) Bucket:** loans are **grouped by how late the oldest unpaid payment is**: Current (0 days), **1–29 days**, **30–59 days**, **60–89 days**, and **90+ days** (considered non-performing).
- **Risk Tier:** a simplified 4-level scale used for dashboard reporting: **Tier 1 (Low Risk)**, **Tier 2 (Moderate Risk)**, **Tier 3 (Elevated Risk)**, **Tier 4 (High Risk / Watch List)**. Real institutions often use finer-grained internal rating scales (e.g., 9–12 point); this project uses a simplified 4-tier scale intentionally, to keep the dashboard readable at a glance.
- **Concentration Risk:** the **share of the total** portfolio **exposed to a single region or sector**; a high concentration means a single shock (e.g., drought, commodity price drop) could affect a large portion of the portfolio at once.
- **Watch List:** loans that have recently **moved into a higher risk tier** or delinquency bucket **since the last data refresh**, surfaced for proactive follow-up.

Data refreshed monthly. Current data through:

Latest Snapshot Month
July, 2026

NOTE: This is a fictional dataset for portfolio demonstration purposes.

Loan Detail (Drill through)

Right-click any loan on the Watchlist to drill through to its full attributes and 24-month balance history.
